

2022 FLYSTRIKE RD&E TECHNICAL FORUM

Development of a Flystrike Vaccine

Tony Vuocolo – CSIRO

10 August 2022

Striking back at Flystrike Development of a Flystrike Vaccine (research update)

The journey so far.....

Sheep blowfly vaccine targets

Salivary Gland

- Secretory proteases
- critical in strike establishment
- ~ 1000 predicted proteins
- ~ 80 larval specific

Cardia and Anterior Midgut

- Peritrophic membrane (produced by specialised cells)

- Lines gut
- Protective and digestive function
- Amenable to immunological targeting
- Function knockout potentially lethal

Vaccine Primary Target

Sheep Blowfly larval midgut and PM

Peritrophic matrix (PM) is a meshwork of highly associated proteins and chitin

The native antigen approach (Type N)

a) Using larvae against larvae for vaccine production

Native antigen vaccine

Peritrophic Matrix
Made by specialised cells
In cardia and anterior mid-gut

Native protein mix from Peritrophic matrix

Type "N" Vaccine

Larvae in lab culture

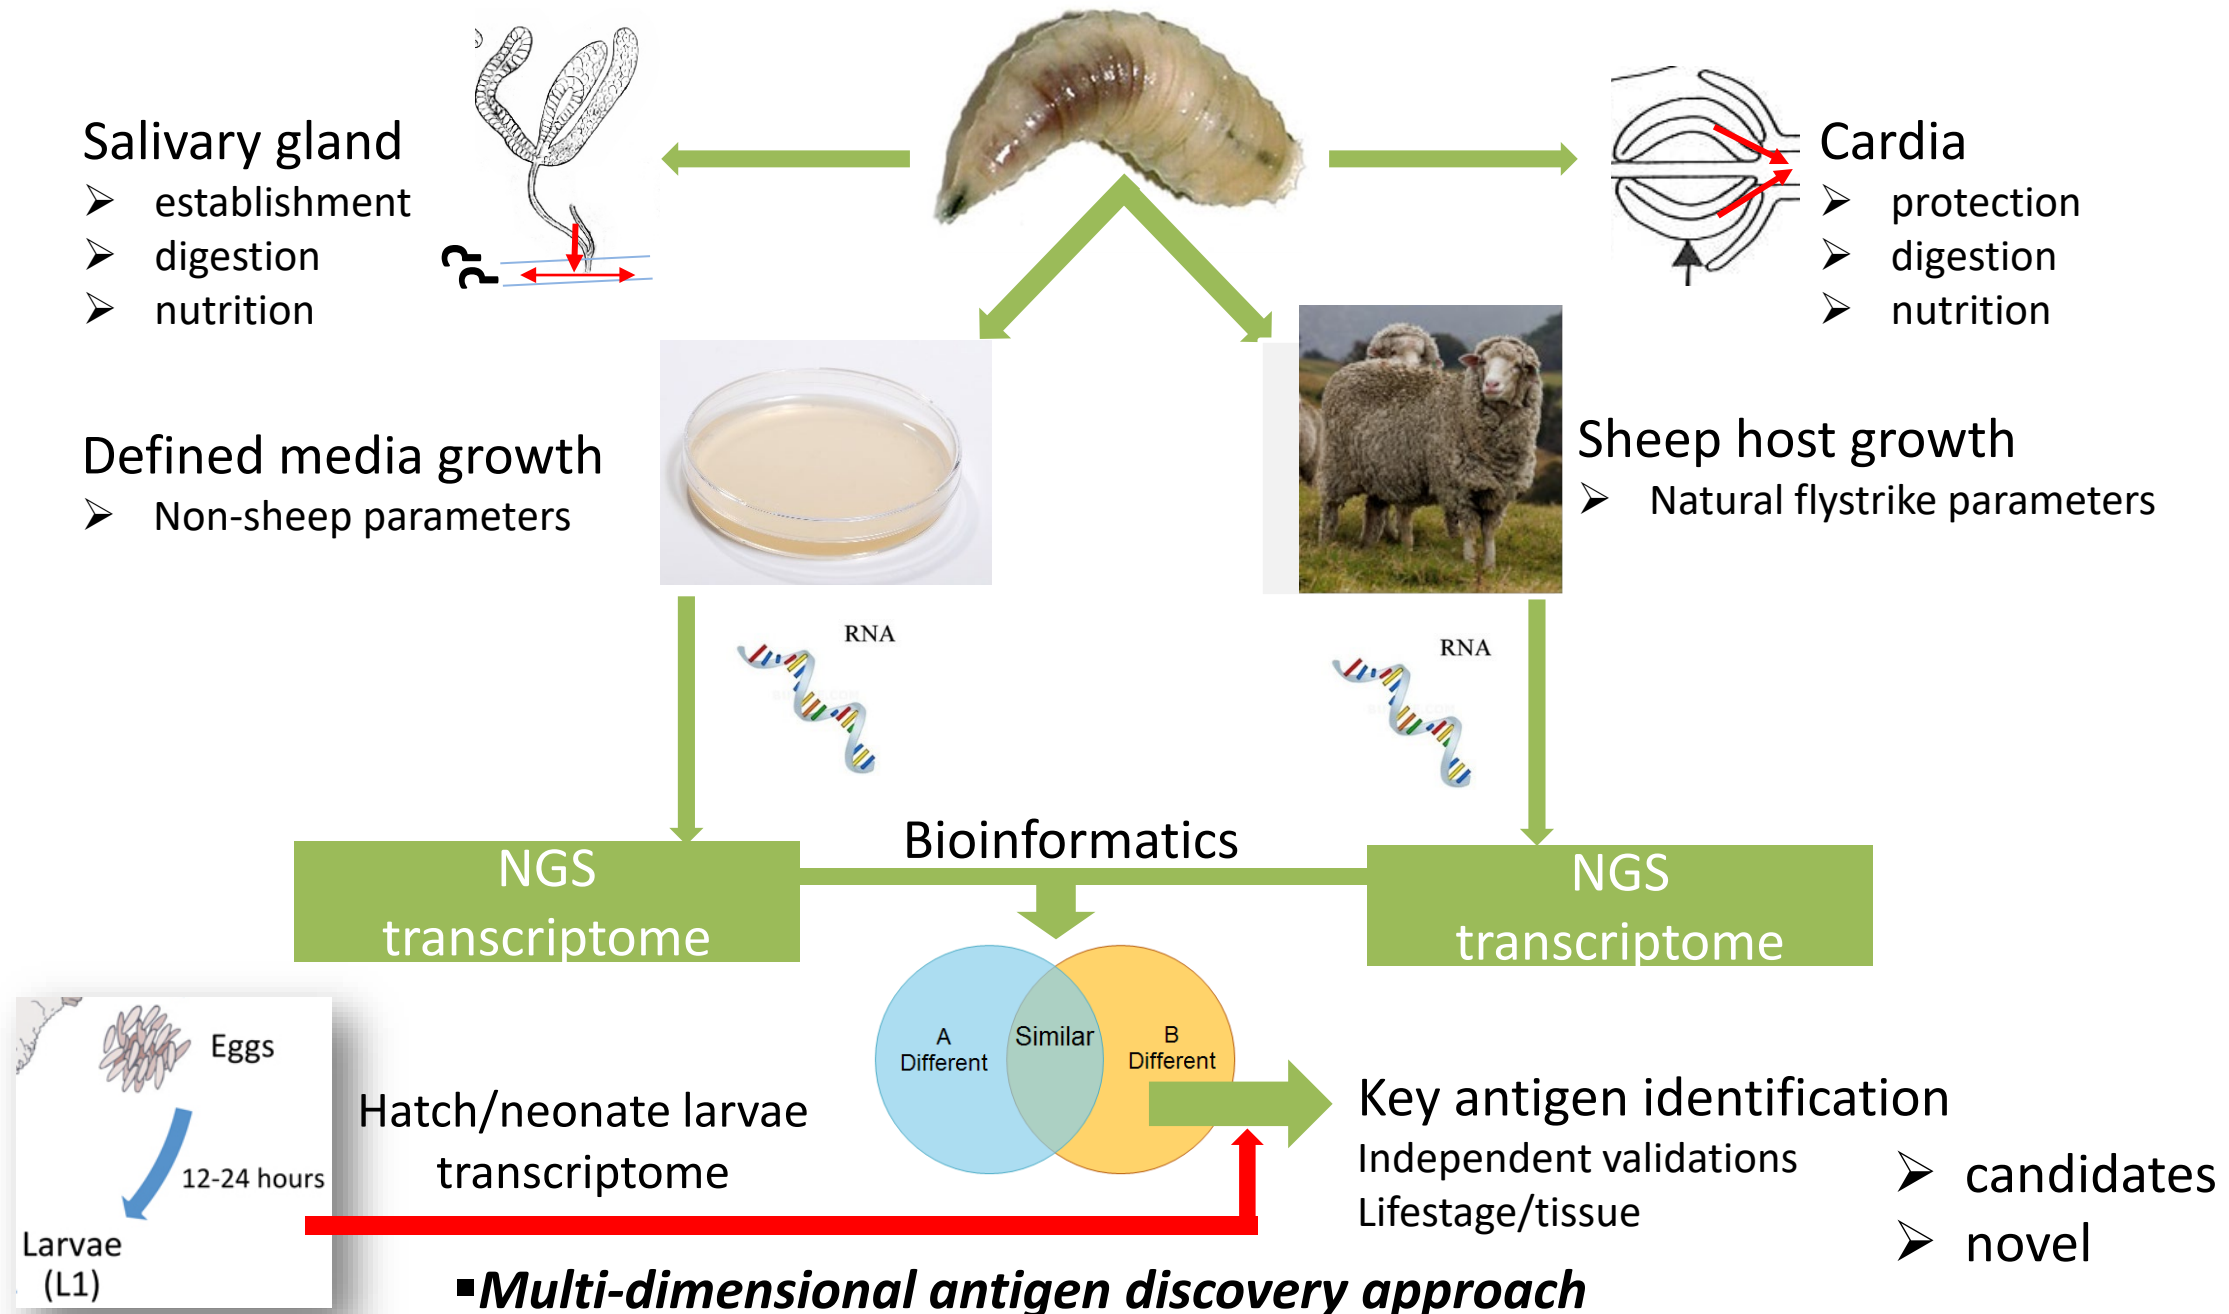

Dissected larval anterior mid-gut

Specific Antigen identification strategy

b) Recombinant antigen approach (Type R)

- Key: Vaccine target antigens involved in larval establishment and early growth
- Multi-dimensional antigen discovery process
- Extend and refine foundation knowledge of host-parasite interaction

Vaccine Approach: Antigen Classes under Investigation (Type R)

Class 1: Peritrophins

Class 3: Mucins

Chitin fibrils

Class 2: Peritrophin-Mucins

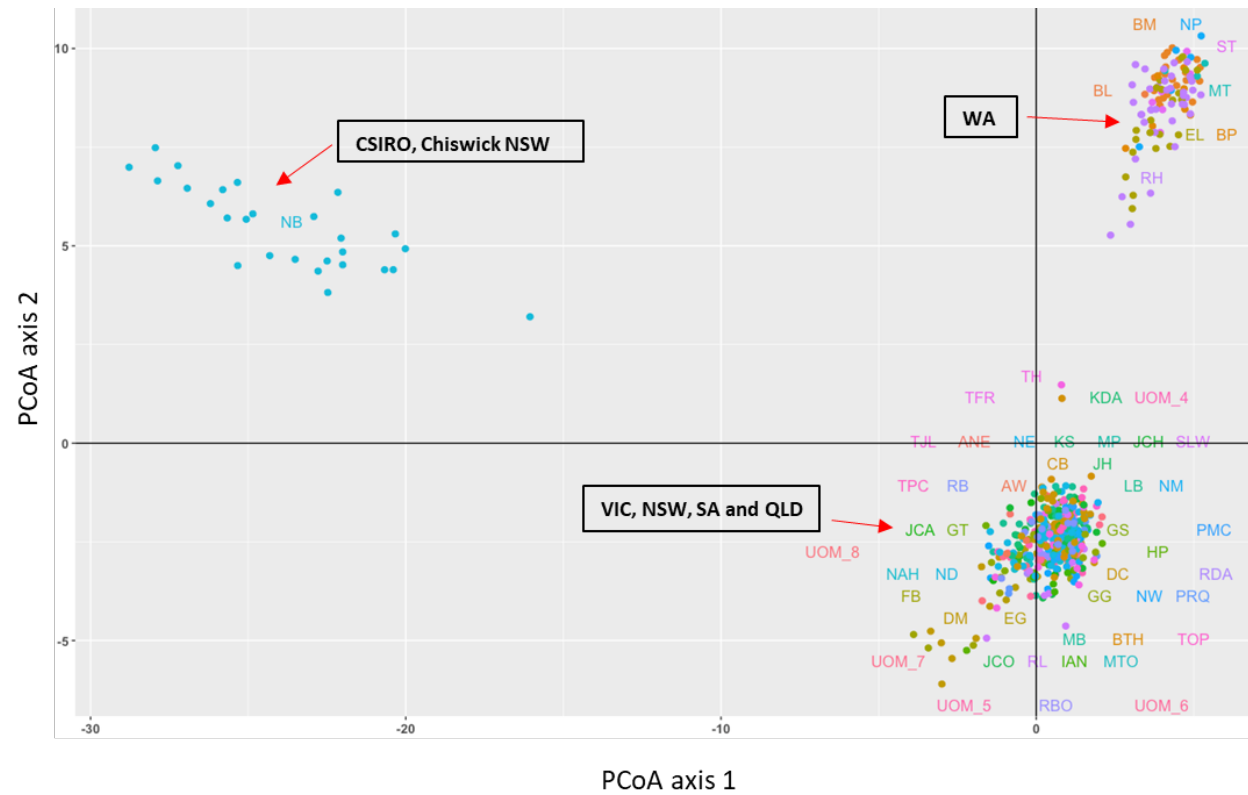

Class 4: Chitinases

.....Block/disrupt/remodel/perforate/compromise.....

Vaccine Approach: Other Antigen Classes under Investigation (Type R)

Population studies on blowfly populations help inform for strain variation implications to vaccine design

Trent Perry
Clare Anstead
Vern Bowles
Shilpa Kapoor

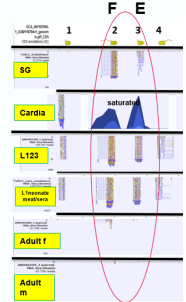

Dots reflect protein differences between populations

From alignments presented in last meeting (August 2021): The NB strain has 5 polymorphisms to the reference lab strain out of the 12 polymorphic sites identified as present in more than one sequenced populations.

We are using Insect cells as factories for vaccine production (Type R)

Candidate discovery

Protein-encoding gene sequence engineered for recombinant production

Lepidopteran / Dipteran

In collaboration with

Prototype vaccine tested in sheep

Formulate

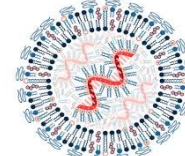

Insect cells in culture

Bacterial *E.coli* culture

mRNA approach

} Not suitable for our complex antigens

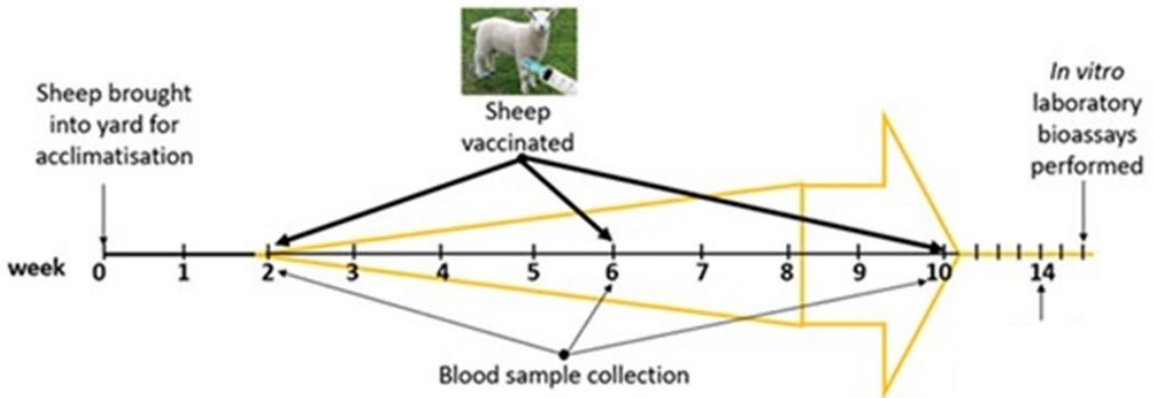

Vaccination trial : In vitro larval feeding bioassay (Models 1, 2 and 3)

Recombinant protein

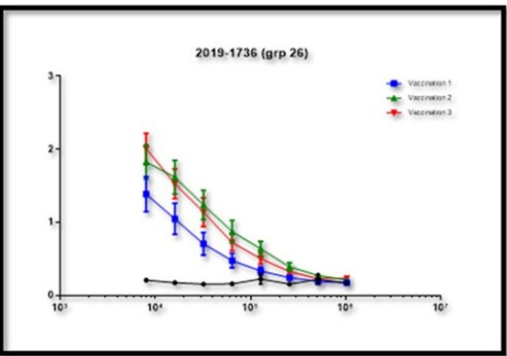

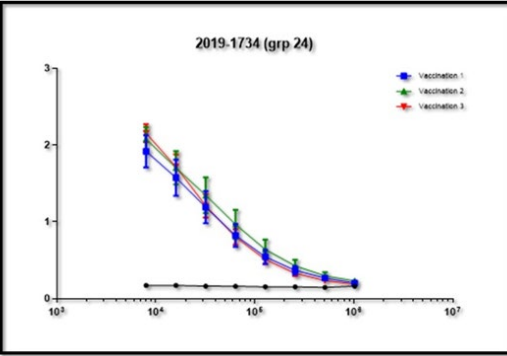

Vaccination trial

Flystrike prototype vaccine studies

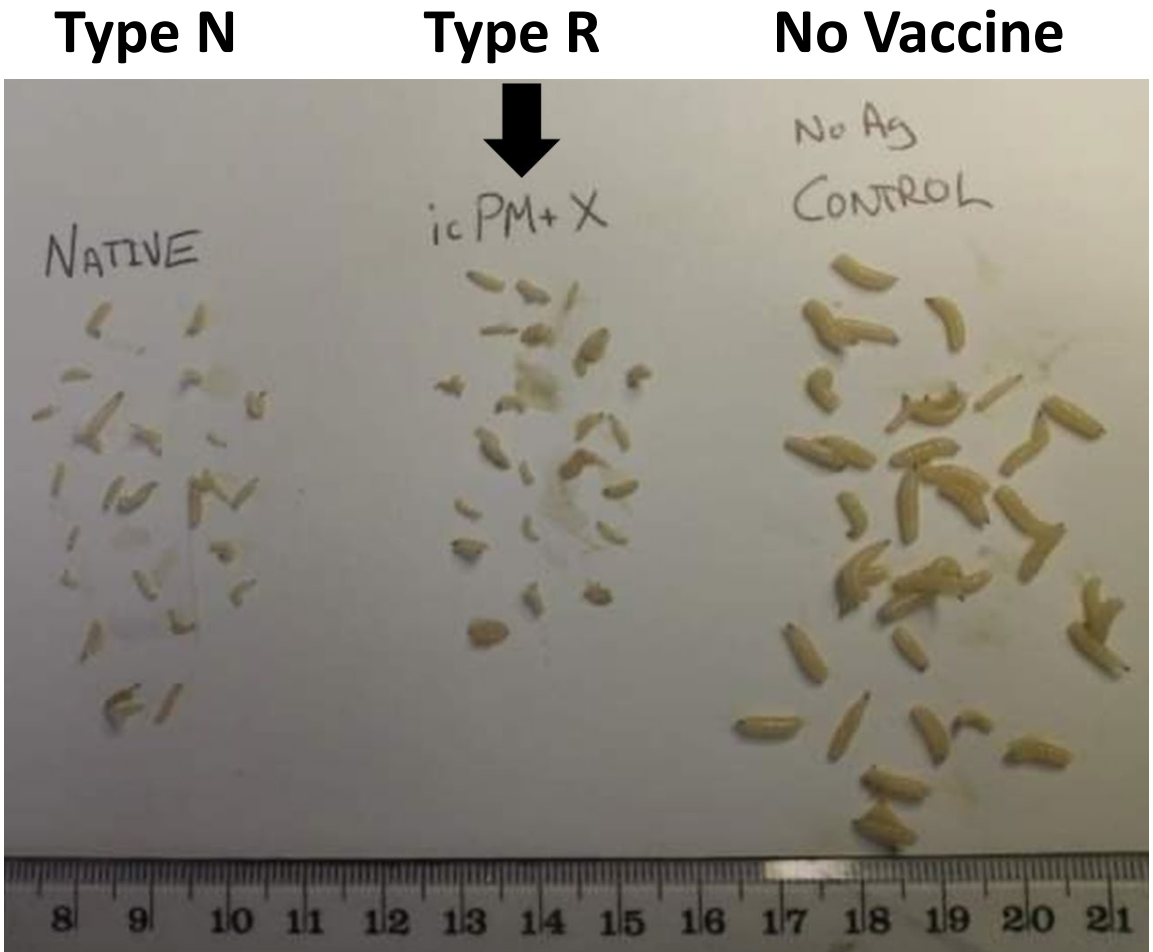

Antibody assessment

In vitro bioassays (skin/wool/biomatrix)

A vaccine could stop or reduce severity of flystrike?

72 hour growth in vitro/skin model/immune sera

Flystrike Vaccine – what next

Type N
Type R
No Vaccine

- Translate promising preliminary results to on-sheep effects
- Significant challenge

~15% weight reduction

Future Science

- ✓ **Exploring and enhancing skin immune response to the Flystrike Vaccine**
- ✓ **Adjuvant technology / Delivery mechanism**
- ✓ **Applying the science of Glycomics to vaccine development**
- ✓ **CSIRO supporting a Future Science Platform initiative in novel parasite vaccines**

Summary – take home points

- ✓ Step 1: Used foundation knowledge to expand potential of vaccine development
- ✓ Step 2: Identified and characterise potential vaccine antigen targets
- ✓ Step 3: Engineered and produce prototype vaccines (>50 prototypes tested in sheep)
- ✓ Step 4: Assessed immune response in sheep and tested efficacy using a range of laboratory bioassays. (1) native and a (2) recombinant cocktail vaccine confer up to 80% growth inhibition of larval growth *in vitro*.
- ✓ Step 5: The two current lead vaccines have been tested in sheep and assayed for on-sheep protection. On sheep effects translate to 10-20% growth inhibition of larvae. A lot to be done to improve this on-sheep efficacy.

Step 6: Optimise vaccine: key antigen formulation, adjuvant and delivery method, assessment of period of protection studies are currently underway.

Step 7: CSIRO Novel vaccine platform initiative underway.

Step 8: Partner with Veterinary Pharmaceutical company to commercially develop and deliver to the sheep industry
