Breeding for Breech Strike Resistance

Re-cap

- Selective breeding is a good alternative because it is minimal intervention
- The trouble with disease traits:
 - We need indirect selection criteria
- Previously reported on subsets of data, this is 'final iteration' with all data included

Objectives

1. Evaluate potential indirect selection criteria for breech flystrike ✓
2. Develop industry best practice guidelines for including breech strike resistance in Merino breeding programs ✓
3. Make preliminary estimates of heritability and correlations between breech and production traits – the tools to estimate genetic gain ✓

How long will it take?

Response to selection is dependent upon...

Which traits we use

Amount of existing variation

Heritability

Correlations among traits

Trial Outcomes

How many traits in the breeding objective

Relative 'weighting' on those traits

Selection intensity

Generation interval

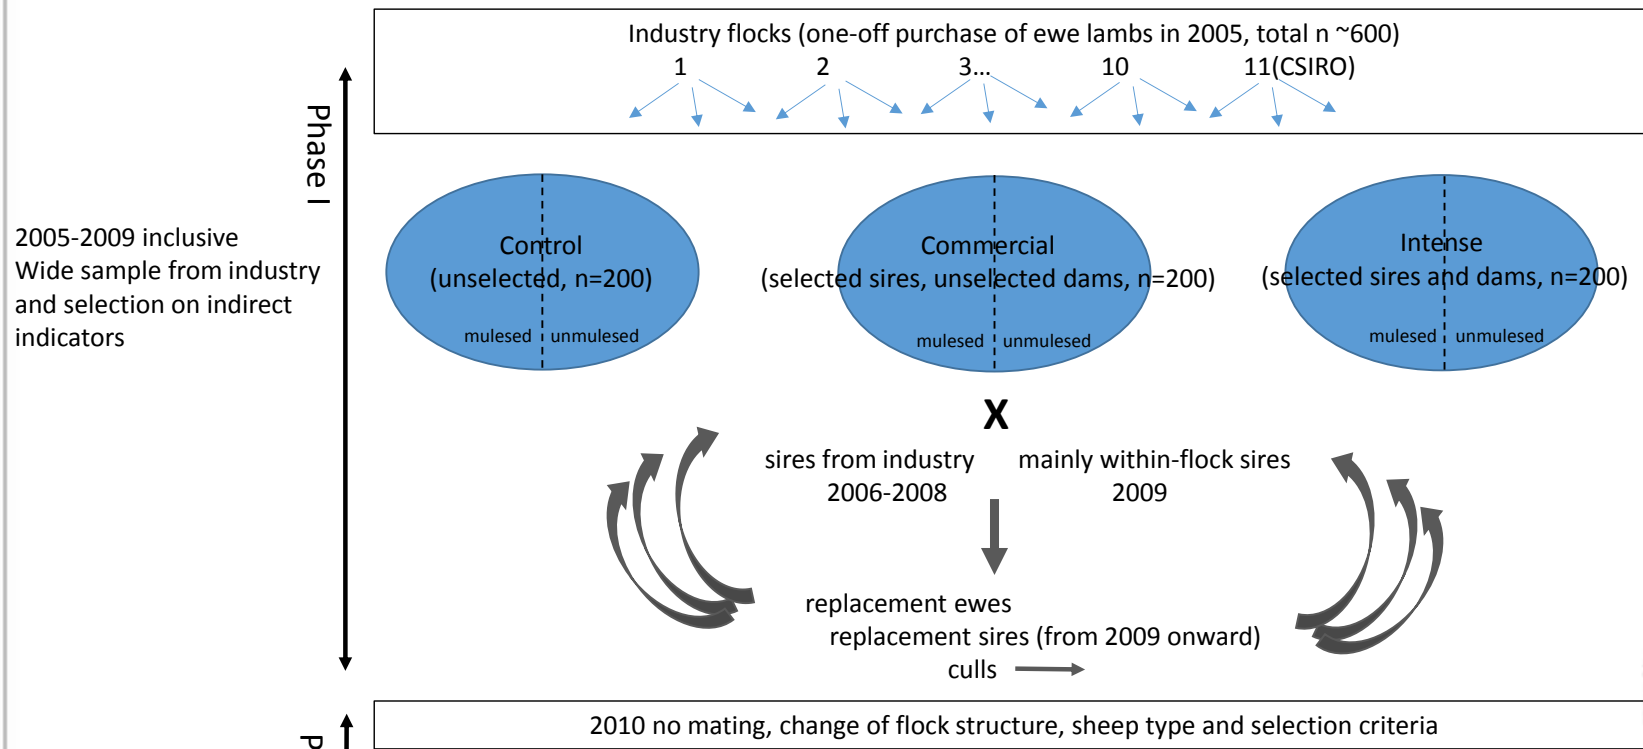

Use (or not) of outside genetics

Differs between breeders

Design, Phase I

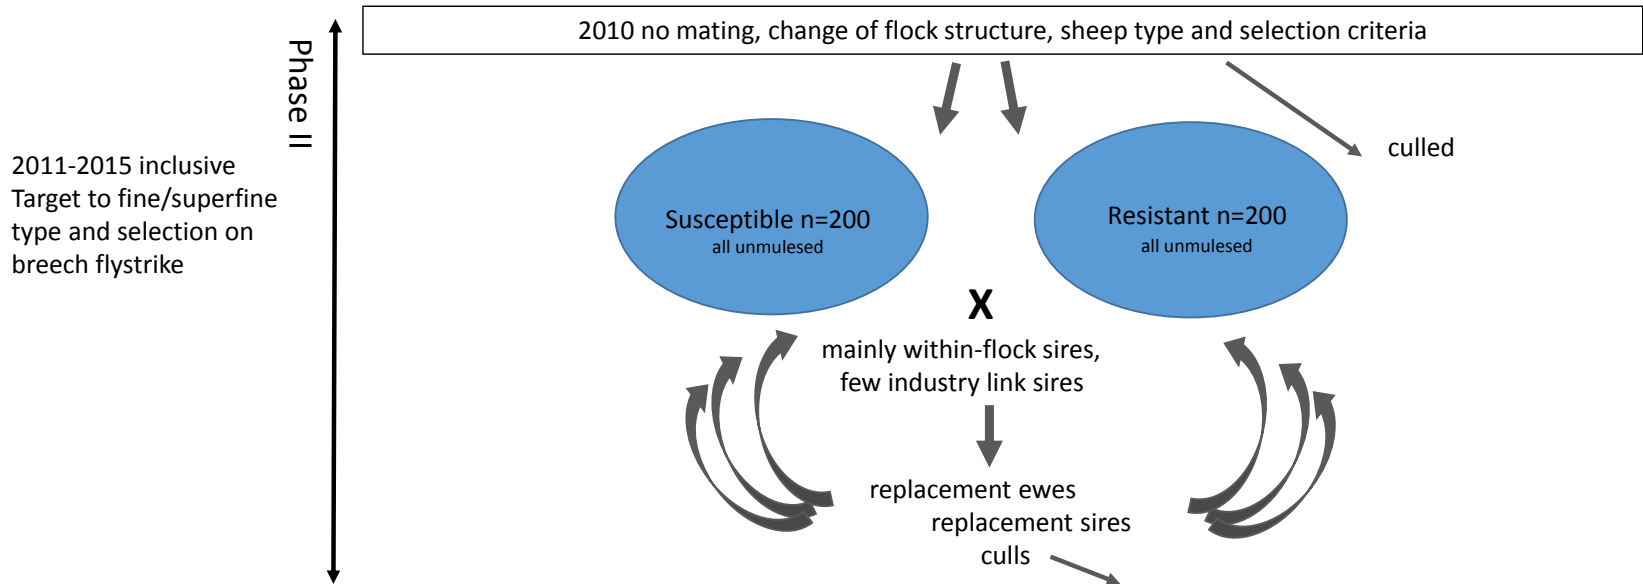

CSIRO, Armidale fine wool sheep, summer rainfall environment
DAFWA, Mt Barker medium wool sheep, Mediterranean environment

2005-2009 inclusive
Wide sample from industry
and selection on indirect
indicators

Design, Phase II

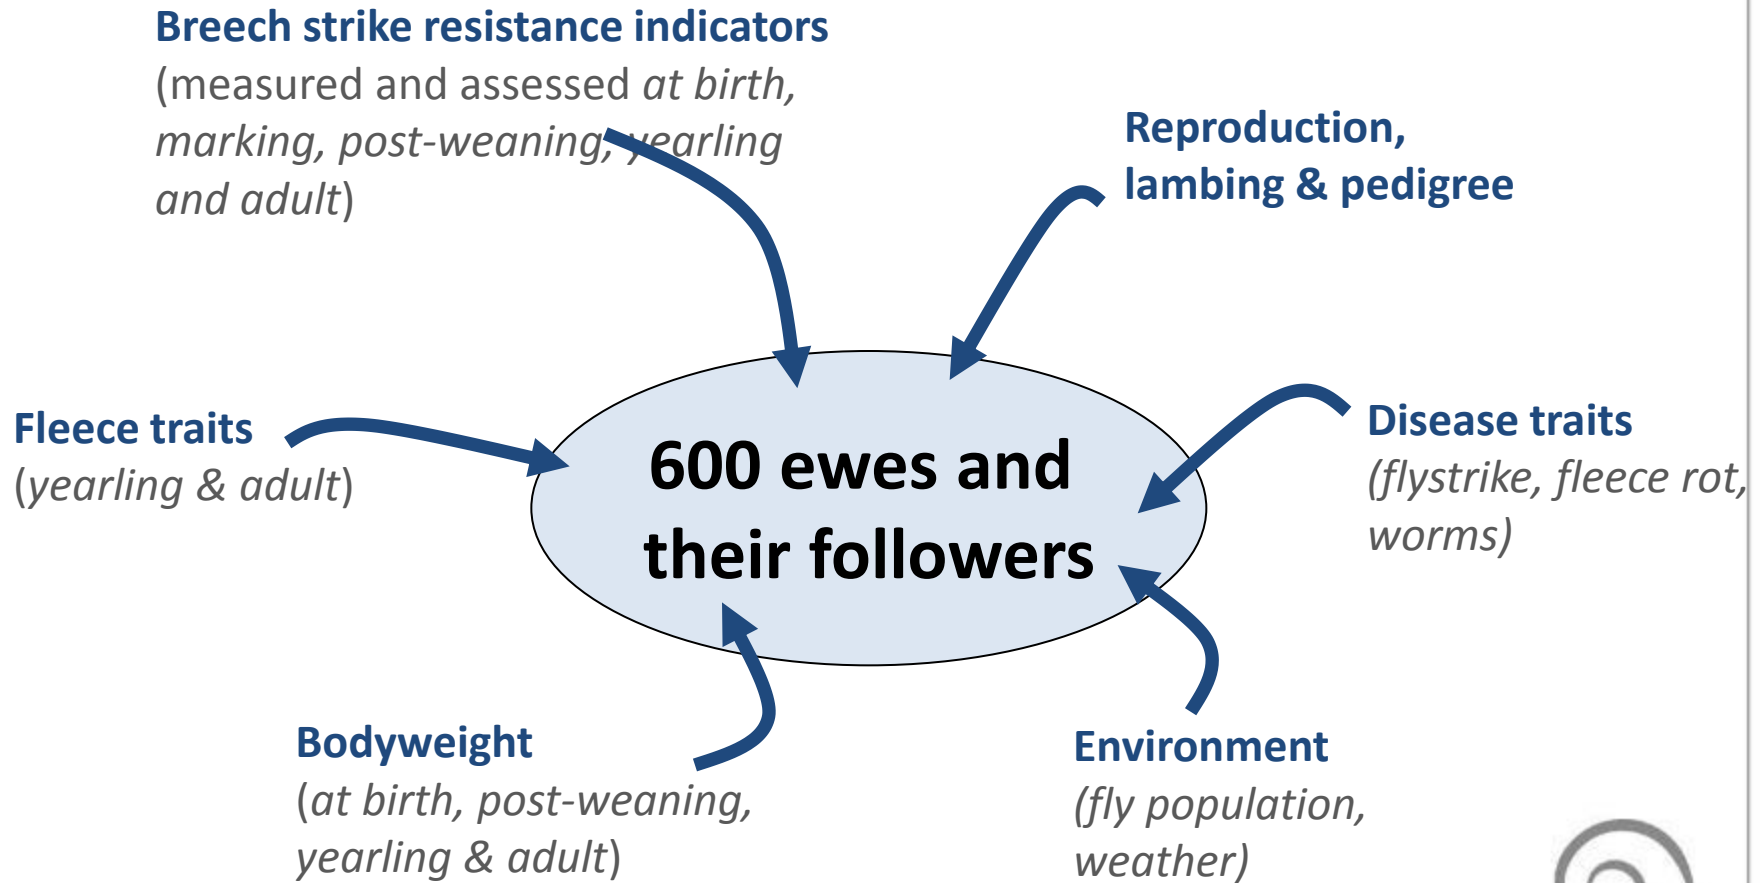

Design changed for Phase 2

Annual calendar

What got recorded

Flystrike recording

- No 'whole flock' preventative treatment (except at marking)
- Sheep checked at least 3 times per week
- Fly season is governed by frost incidence (Oct-Apr inclusive)
- Body strikes recorded separately
- All classes of sheep for as long as they remained in flock
 - Weaners, hogget ewes and rams, breeding ewes, sires

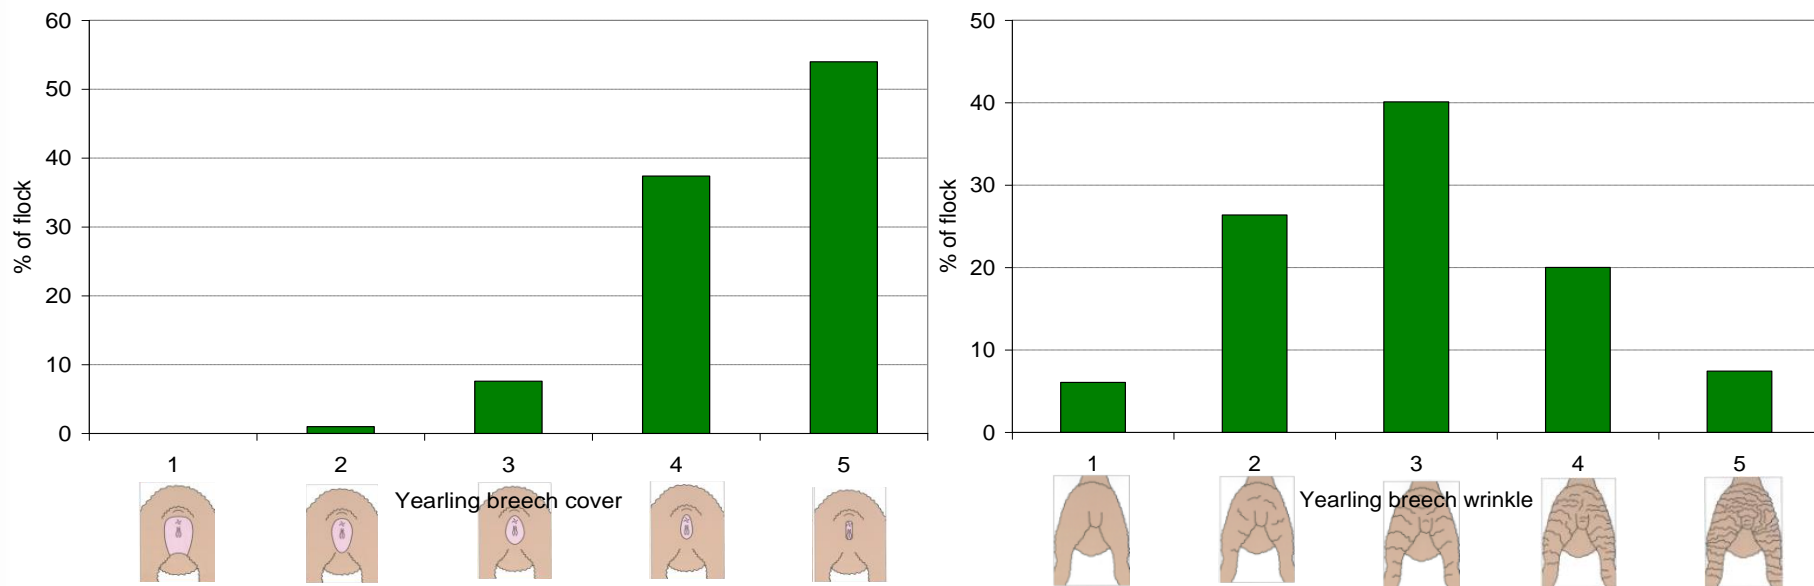

Results

Breech cover and breech wrinkle

Distribution in unselected, unmulesed population

Sheep had high wrinkle and high cover

Flystrike

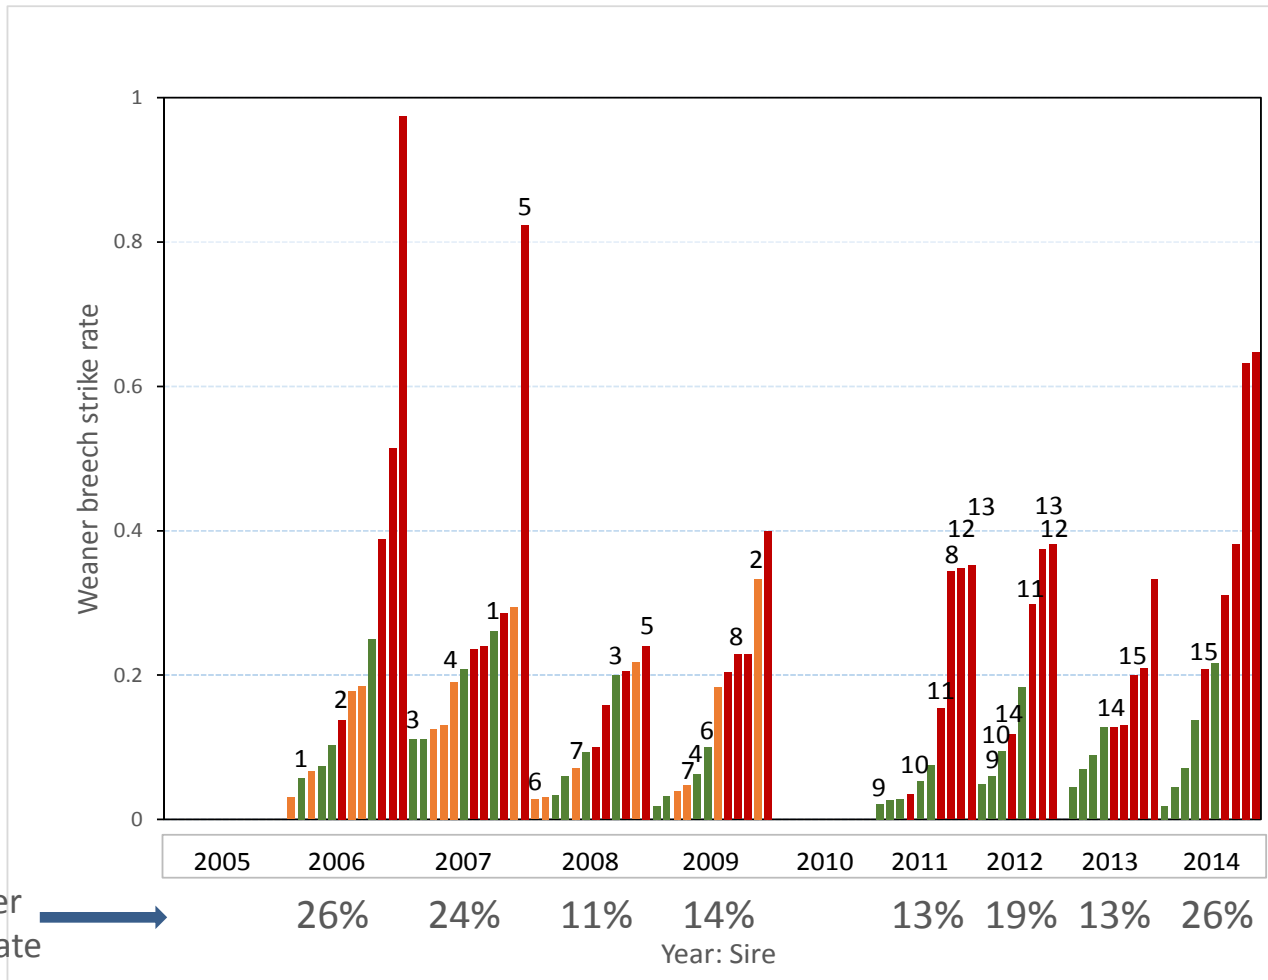

- Rates vary with year (climate), overall ~20% weaner breech strikes
- Weaners most susceptible

| Across years | Weaners | Yearling ewes | Adults |
|--------------|--------------|---------------|-------------|
| Ave BRSTR | 18.6% | 9.9% | 10.9% |
| Range BRSTR | 11.4 – 25.8% | 2.1 – 25.1% | 1.8 – 23.3% |

- Females more likely to be struck than males
- Body strikes up to 5-6% in Phase I (due to use of sires not suited for high summer rainfall but had good breech traits)
- Body and Breech strike not correlated

Sire group differences in breech flystrike

Average weaner breech strike rate

Rainfall during flystrike season (mm)

LTA annual rainfall ~800mm, LTA for flystrike season rainfall 540 (~70%)

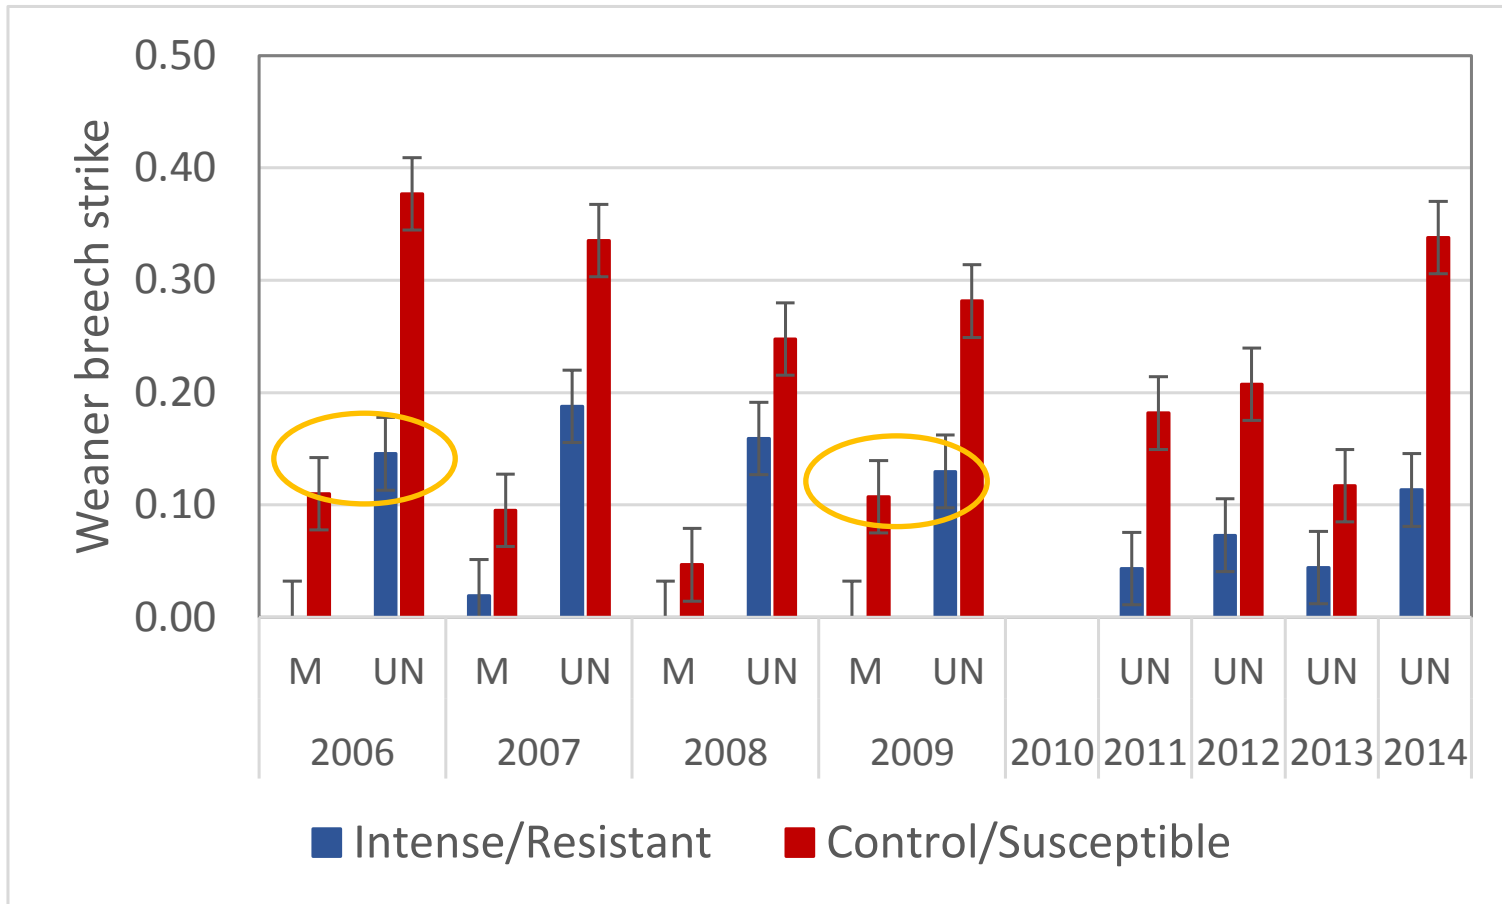

Flystrike risk with indicator traits

Gold columns where flystrike rate similar to mulesed animals

Weaner breech strike (2006 – 2014)

In some years unmuled resistant sheep had similar strike rates to muled controls

Muled resistant sheep very low strike rates

Breech flystrike

Individual sires had large impact on trends in some years
 Low strike years harder to get accurate assessments

Phenotypic trend

Genetic trend

Raw mean breech flystrike (%)

| | Mulesed | Unmulesed |
|-------------------------------|-------------------|---------------------|
| Phase I (Control & Intense) | 6% | 31% |
| | Intense/Resistant | Control/Susceptible |
| Phase I (mulesed & unmulesed) | 10% | 33% |
| Phase II (all unmulesed) | 8% | 30% |

There was no 2010 drop

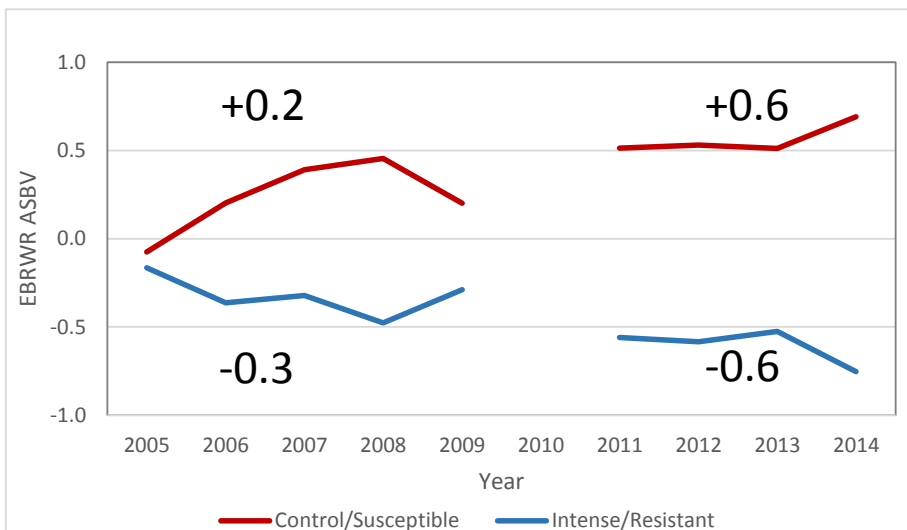

Breech wrinkle

For phase 2 classed out sheep not suited to high summer rainfall, impacted on phenotype

Phenotypic trend

Genetic trend

Raw mean breech wrinkle score

| | Mulesed | Unmulesed |
|-------------------------------|-------------------|---------------------|
| Phase I (Control & Intense) | 1.9 | 2.6 |
| | Intense/Resistant | Control/Susceptible |
| Phase I (mulesed & unmulesed) | 2.0 | 2.6 |
| Phase II (all unmulesed) | 2.4 | 3.3 |

Breecch wrinkle and breecch strike

Sire eBRWR ASBVs and wBRSTR EBVs

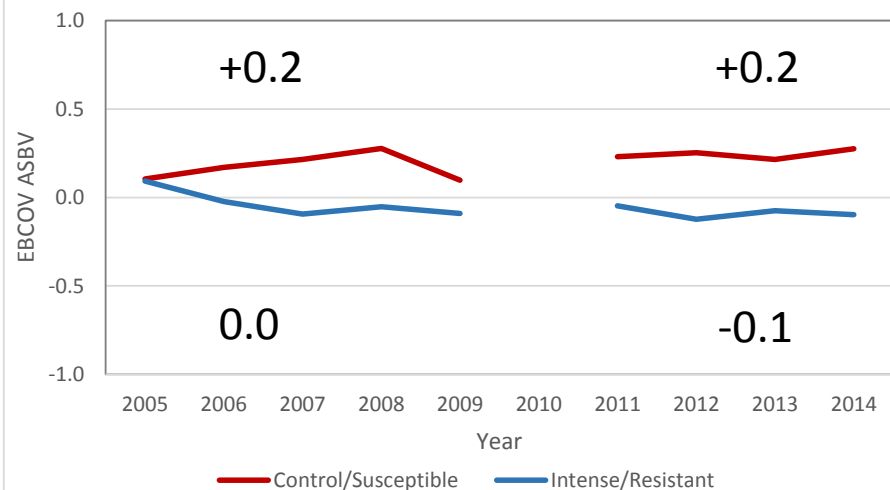

Breec cover

Phenotypic trend

Genetic trend

Raw mean breech cover score

| | Mulesed | Unmulesed |
|-------------------------------|-------------------|---------------------|
| Phase I (Control & Intense) | 3.9 | 4.3 |
| | Intense/Resistant | Control/Susceptible |
| Phase I (mulesed & unmulesed) | 3.8 | 4.3 |
| Phase II (all unmulesed) | 3.8 | 4.3 |

Dag

Armidale is a low dag environment

Phenotypic trend

Genetic trend

Raw mean dag score

| | Mulesed | Unmulesed |
|-------------------------------|-------------------|---------------------|
| Phase I (Control & Intense) | 1.5 | 1.7 |
| | Intense/Resistant | Control/Susceptible |
| Phase I (mulesed & unmulesed) | 1.6 | 1.8 |
| Phase II (all unmulesed) | 1.2 | 1.3 |

Key candidate traits

| Trait | Variable | Heritable | Correlated with breech strike |
|----------------|-------------|-------------|-------------------------------|
| Breech wrinkle | ✓✓✓ 0.66 | ✓✓✓ 0.36 | ✓✓ 0.47 |
| Breech cover | ✓✓ 0.37 | ✓✓ 0.24 | ✓✓ 0.35 |
| Crutch cover | ✓✓ 0.38 | ✓✓✓ 0.37 | ✓ 0.28 |
| Dag | ✓✓ 0.37 | ✓ 0.16 | ✓✓✓ 0.81 |
| Urine | ✓✓ 0.39 | ✓✓ 0.22 | ✓ 0.06 |

Based on the genetic parameters estimated for the Armidale flock the genetic gain in breech strike would be greater if the selection criterion was either BRWR and or DAG rather than BRSTR itself (in general agreement with the WA data).

Fixed effects on wrinkle

Effects of birth-rearing type and age-of-dam

Singles $\sim \frac{1}{2}$ score more wrinkly than twins

Adult dam $\sim \frac{1}{4}$ score more wrinkly than maiden

Breech flystrike genetic parameters

| Trait | V_p | Weaner | Yearling | Adult |
|----------|-------|--------------------|--------------------|--------------------|
| Weaner | 0.21 | 0.18 (0.03) | 0.29 | 0.22 |
| Yearling | 0.09 | 0.92 | 0.16 (0.03) | 0.33 |
| Adult | 0.61 | 0.40 | 0.26 | 0.26 (0.05) |

Heritability bolded

Combine trait all ages $V_p = 0.13$ and Heritability 0.20 (0.03)

Genetic correlations, breech and production traits

Correl'n between Wrinkle & Fleece Weight similar to correl'n between Fleece Weight & FD

| | Breech wrinkle | Breech cover | Dag | Breech strike |
|----------------------|----------------|--------------|-----------|---------------|
| Body weight | ✓ (-0.25) | ✓ (-0.42) | ✓ (-0.23) | ~ |
| Greasy fleece weight | ✗ (0.36) | ✓ (0.11) | ✓ (-0.21) | ~ |
| Clean fleece weight | ✗ (0.27) | ✓ (0.11) | ✓ (-0.20) | ~ |
| Yield | ✓ (-0.18) | ~ | ~ | ✓ (-0.12) |
| Fibre diameter | ~ | ✗ (-0.14) | ✗ (-0.22) | ✗ (-0.25) |
| CV fibre diameter | ✓ (0.37) | ~ | ✓ (0.30) | ✓ (0.31) |
| Fibre curvature | ~ | ~ | ~ | ~ |
| Staple length | ✓* (-0.36) | ✗ (0.17) | ~ | ✓ (-0.16) |
| Staple strength | ~ | ~ | ✓ (-0.22) | ✓ (-0.17) |

✓ = favourable ~ = neutral ✗ = unfavourable

How industry uses breech traits

Stud

(2% of sheep)

Performance recorded

- Record breech traits on ewes and rams for ASBVs
- Include breech traits in selection decisions (within-flock selection)
- Purchase sires/semen with ASBVs (across flock selection)
- Multi-trait index incorporating breech traits (yet to come)

'Traditional'

Commercial

(98% of sheep)

- Cull flock ewes on visual assessment of indirect indicators
- Cull sheep that get flystruck
- (Can purchase semen or rams with ASBVs for breech traits)

Where we're at

- Changing wrinkle and cover by 1-1.5 units gives effect similar to mulesing
- In 10yrs demonstrated gains in breech flystrike resistance almost as good as mulesing (low dag environment)
 - But, we used everything at our disposal
 - a) initial buy in of selected dams
 - b) across flock selection of sires esp. in early years
 - c) within flock selection predominantly on breech traits
- Industry can not change so quickly as there are many more traits in the breeding objective
- Industry has to deal with
 - a) unfavourable relationships between breech traits and production traits
 - b) no real price premium for unmulesed wool

Take home message

1. This works, but no single simple 'recipe' for every grower
2. Rate of response will be different in every flock
3. Choice of indirect selection criteria will vary with sheep/wool type, production system and environment (climate)
4. Like any selective breeding, gains are cumulative and permanent
5. Selective breeding is a useful tool in the IPM tool-kit

(and whether its at the top or bottom of the tool-kit, is up to the individual)
