Cheers to 100 years

WE HAVE YOUR WOOL & SHEEP NEEDS COVERED:

- ✓ Advanced Wool Marketing options.
- ✓ Livestock Exchange.
- ✓ Rural Merchandise
 - Sheep Handlers – Te Pari & Peak Hill Industries.
 - Animal health & nutrition
 - Fencing & irrigation
- ✓ Livestock Consultancy Service
 - Nutrition Management and Practical Calendar of Operations
- ✓ Precision Sheep Management & Data Collection
- ✓ R&D Tailored For Commercial Outcomes.
- ✓ **WoolClip rebates available.**

Moses & Son are proud supporters of the PWWMC

From the Challenge Convenor

The Peter Westblade Memorial Merino Challenge 2018-2020 has once again proven beyond any doubt the capacity of superior Merino genetics to dramatically affect the profitability of any sheep and wool business.

The PWMMC provides a platform for all breeding philosophies and we encourage all commercial Merino breeders to test and benchmark the relative merits of their flocks' genetics. The two years of the trial has provided vastly different seasonal conditions in terms of nutrition with the second year allowing the wethers to display their full genetic merit.

The PWMMC has attracted teams from across Australia. States represented in the Challenges include Western Australia, Victoria, and New South Wales. The teams represent a wide cross section of the Merino bloodlines and major wool and sheep meat growers. Entrant's flocks are typically larger scale and professionally managed.

The information contained within this report aims to give entrants and indeed the wider Merino breeding community an understanding of the diversity and production capacity of Merino genetics across a range of bloodlines. The variation in the general merino sheep population of Australian would be significantly more than that measured within this trial.

The data is presented in several formats highlighting the entrant's different breeding objectives. As expected, there is not only production differences between the entrant teams but also within the teams.

Peter Westblade was passionate about breeding the most profitable sheep, assisting his clients and fostering young people in the Merino industry.

I feel very proud that we can run this Challenge in Peter's name and thank all supporting partners and sponsors for their shared vision, financial and moral support.

Financial and in-kind contributions from Australian Wool Innovation, Sally Martin Consulting Pty Ltd, Moses and Son Wool Broker, Bluechip Livestock, Zoetis, Riverina Wool Testers, Conqueror Milling, Worner Transport, Kooringal Horse Stud, NSW DPI and Fletchers International Exports have made the PWMMC 2018-2020 possible.

I trust that the information within this report gives the entrants a very strong understanding of their flock's genetic strengths and weaknesses arming them with the power to make more informed decisions within their own businesses.

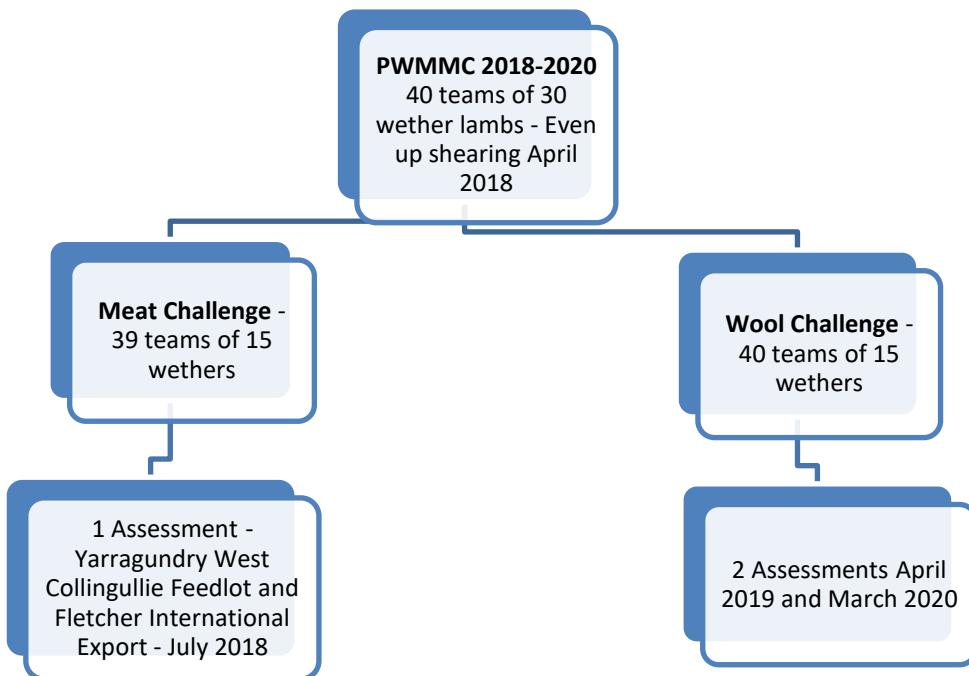

Thanks to my family for your support and to the entrants that have placed their sheep within my care.

Craig Wilson

About the Peter Westblade Merino Challenge (PWMMC)

Australia's largest commercial evaluation of Merino genetics the Peter Westblade Memorial Merino Challenge (PWMMC) assists Merino breeding enterprise make more informed decisions on their Merino genetics. The PWMMC has two components consisting of a Meat Challenge and a Wool Challenge. The Meat Challenge is a unique initiative of the PWMMC measuring commercially relevant growth and carcase traits.

The information and data analysis presented in this report shows entrants and the wider sheep industry the financial opportunities that exist through high performance Merino genetics and is specifically related to the Wool Challenge outcomes.

Peter Westblade – 1949 to 2008

Peter Westblade (pictured right) has been described as a visionary, innovator and successful stud Poll Merino Breeder; he was also an inspiring sheep classer using objective measurement, a mentor to many and a champion of worthy causes.

Peter Westblade was born in Lockhart, NSW and left school at 16 years of age. Peter established himself by buying his grandfather's 400-hectare farm with 10 per-cent deposit and 90 per-cent borrowed money.

Working in the shearing sheds to help meet the repayments, he went on to build that initial purchase into the 'Pastora' property of today, covering nearly 3,900 hectares running 4,700 breeding ewes.

His involvement in sheep breeding began in the early 1970's when he identified his desired traits for a profitable sheep many years ahead of the industry.

Peter Westblade's son Tim and his wife Rachel now continue the dedication and passion for Merino's and the management of 'Pastora'.

1.0 Trial Design

The PWMMC 2018-2020 (Merino Challenge) evaluates both commercial carcase and wool attributes of randomly selected 2017 drop wether lambs. Most of the major wool growing regions in Australia are represented through the 40 teams of 30 wether lambs. Refer to pages 8 for entrant details.

1.1 How the wethers were selected?

The selection protocols for the Merino Challenge stipulate entrants must have either purchased rams directly from the ram breeder nominated as their bloodline source for a minimum of five years (in line with the NSW DPI National Wether Comparison Guidelines) or have bred their own rams and not be actively selling rams. This year we have accommodated Merino Studs and they have been highlighted in the entrant details with an asterisks (*) on page 8. Entrants that have not used a single source for their Merino genetics are known as a mixed bloodline.

The standard protocol for all sheep entering the Merino Challenge required entrants to yard a minimum of 90% of their 2017 drop wether lambs. From this group, a nominated independent person randomly drafted off 54 wether lambs from which 30 wether lambs were selected and tagged with two unique permanent tags. Entrant teams were then transported to a property near Collingullie, where they were inducted and shorn (even-up).

1.2 How the wether lambs were allocated to the Wool Challenge and Meat Challenge?

A body weight was taken prior to the even-up shearing (April 2018) and was used to randomly allocate wethers to the Wool Challenge and Meat Challenge. The allocation was within team, subsequently the wool length of individual teams did not need to be taken into consideration.

The random allocation of each team of 30 wether lambs enables an even distribution of body weights to either the Wool Challenge or Meat Challenge.

1.3 How to read and interpret this report?

The 2020 Wool Challenge report is a snapshot of the wool productivity drivers of the participating entrant teams. When the 2018-2020 PWMMC commenced there was an age spread from May to October 2017.

2.0 Entrant Details

The PWMMC has operated in the current format since 2010. The 2018-2020 PWMMC is the fifth trial of its kind. 2018-2020 trial has seen 40 breeders have entered teams from NSW (34), Victoria (5) and Western Australia (1). Since the PWMMC inception there have been 250 teams evaluated from 5 states of Australia, Table 1 shows the distribution of teams.

Of the 250 teams entered since 2010, 50 percent of entrants have entered more than once either entering a team in all five PWMMC or at varying intervals over the past 8 years to benchmark progress and breeding program changes. There are 62 bloodlines or ram sources represented across all the PWMMC trials and currently there are 26 bloodlines represented by two or more teams. The repeat entrants provide excellent linkage between years and trials and will allow across year analysis in the future that will include both carcase and wool data. Table 3 presents the entrant details, location, bloodline and age group.

Table 1 - Number of teams represented by state

States	2010-12	2012-14	2014-16	2016-18	2018-20	Total

3.0 Merino Challenge Management

The PWMMC 2018-2020 commenced in April 2018 when the wether lambs were shorn to a standardised wool length (even-up shearing). Post even-up shearing the Wool and Meat Challenge wether lambs were split into their respective Challenge mobs. The Wool Challenge wethers have been run together on improved and annual pastures near Lockhart, New South Wales. Under drought conditions the wethers were containment fed with silage for most of the year. The Meat Challenge wethers were run at “Yarragundry West” Collingullie on Lucerne pastures and in the lamb feedlot prior to processing in 2018. The Wool and Meat Challenges are reported separately.

3.1 What traits were measured in the Wool Challenge?

Table 4 lists all the wool traits that were measured during the first year of the Wool Challenge.

Table 4: Traits measured in the PWMMC Wool Challenge

Live weight

BWT Body weight (shorn body weight) (kg)

Wool

FD Fibre Diameter (um) – mid side and pin bone

FDCV Coefficient of Variation of Fibre Diameter

SD Standard Deviation of Fibre Diameter

Comf Comfort Factor (% > 30 micron)

WYld Washing Yield (%)

SchYld Schlumberger Yield (%)

GFW Greasy Fleece Weight (kg)

GWW Greasy Wool Weight (kg) – combined fleece and oddment weight

CFW Clean Fleece Weight (kg)

CWW Clean Wool Weight (kg) – combined fleece and oddment weight

4.0 2018 - 2020 Wool Challenge Summary

The second shearing assessment of the 2018-2020 continues to highlight the variation that exists in the Merino industry. Table 5 and Table 6 presents a summary of the averages and ranges for each trait and dollar value for individual sheep within the trial and teams in the Wool Challenge at the 2019 and 2020 shearing assessments, respectively.

The wool and mutton values have been calculated using an 18-month average price in 2019 and a 26-month average price in 2020 and are further explained in Section 5.3. The total sheep value is the combined wool and mutton values. **All wethers were shorn with 12 months wool at the first shearing (2019) and 11 months wool at the second shearing (2020).**

Table 5 – 2019 Wool Challenge Summary

Trait	Unit	Wool Challenge Average	Individual Sheep Min	Individual Sheep Max	Team Min	Team Max
Fibre Diameter	Micron	16.3	13.4	20.5	15.3	18.2
Greasy Fleece Weight	kg	4.9	2.6	7.6	3.7	6.2

4.2 Wool and Mutton Prices

The 2018-2020 Wool Challenge first shearing (2019) results were calculated using an 18-month average for wool and mutton. In the past a 5-year rolling average price has been used, historically the wool price data used to generate the 5-year rolling average ranged from 16 microns and up. In 2019 40% of the wethers had a micron below 16.0 and to accommodate we had to move away from the 5-year average prices until enough wool price data is collated (for micron categories below 16 micron). In 2020 we have used a 26-month average price.

4.3 Clean wool weight and fibre diameter

Figure 1 shows the average team mid side sample fibre diameter (micron) relative to the clean wool weight (%) collected at the 2020 assessment. The clean wool weight is the combination of fleece weight and oddments (pieces and bellies). Teams that have low fibre diameter and high clean wool weights are located in the top left quadrant.

Figure 1 – 2020 Clean Wool Weight Percentage relative to Fibre Diameter Deviation

2017 RECIPIENTS OF THE
PETER WESTBLADE SCHOLARSHIP

Peter Westblade Scholarship

PROVIDING OPPORTUNITIES TO THE NEXT GENERATION OF LEADERS IN THE SHEEP AND WOOL INDUSTRY

The Peter Westblade Scholarship honors the Late Peter Westblade a true visionary passionate about breeding profitable sheep and a strong supporter of young people interested in agriculture.

The Scholarship exists to promote the practical skills associated with the sheep and wool industry and aims to deliver hands on experience and mentoring to young people aspiring for a career in this dynamic industry.

4.4 Wool and Meat Values

The wool and meat value graphs present the average wool value (\$/head) relative to the meat or mutton value (\$/head). Teams that have both high average wool and meat values are located in the top right quadrant.

Figure 2 – 2020 Wool and Mutton Values

Kills the Resistant worms that count in your Region

- Contains the **NEWEST active**, Derquantel (10 mg/mL) in combination with Abamectin (1mg/mL)^{1,5}
- **Newest Anthelmintic Class SI (Spiroindole)¹**
- **Unique Mode of Action¹**
- **Kills multi-resistant worms** - *Haemonchus contortus* (LEV, BZ, ML and CLOS) and *Teladorsagia circumcincta* and *Trichstrongylus colubriformis* (both LEV, BZ and ML)⁵
- **Greater Sustainability** for every farm with **Dual Drench Technology²**
- **Prolongs** the life of older more fragile drenches^{3,4}

early March 2019**

4.5 RAMPOWER Indexes

RAMPOWER Indexes are mob-based within flock selection indexes. They use the same genetic parameters as the indexes reported by Sheep Genetics for MERINOSELECT, refer to Appendix 1 for more information about MERINOSELECT indexes. Indexes are a tool to help select animals for use within a breeding program ensuring that genetic gain in one trait is not made in isolation from other traits. The three indexes reported are Fibre Production, Merino Production and Dual Purpose. A detailed explanation about Sheep Genetic indexes is in Appendix 1 – page 69. Table 9 presents the 2020 shearing results and RAMPOWER indexes. The blue shading highlights the top third, green shading middle third and yellow shading the bottom third for each trait or index.

Table 9 – 2020 Wool Challenge Rampower Indexes

Figures 3, 4 and 5 show the correlations between the 2020 average Sheep Values, generated using the 26-month average prices, and three RAMPOWER production indexes – Dual Purpose (DP), Merino Production (MP) and Fibre Production (FP). There is a high correlation between the team average Sheep Value (wool + mutton) and the DP index (0.84), a moderate to high correlation with the MP index (0.68) and a low to moderate correlation with the FP index (0.41). These correlations are consistent with previous years. Indexes take into consideration the interactions between traits (correlations) and aim to reflect your breeding objective direction. The higher corrections between Sheep Value and the DP index is predominantly driven by the contribution from body weight and fleece weight.

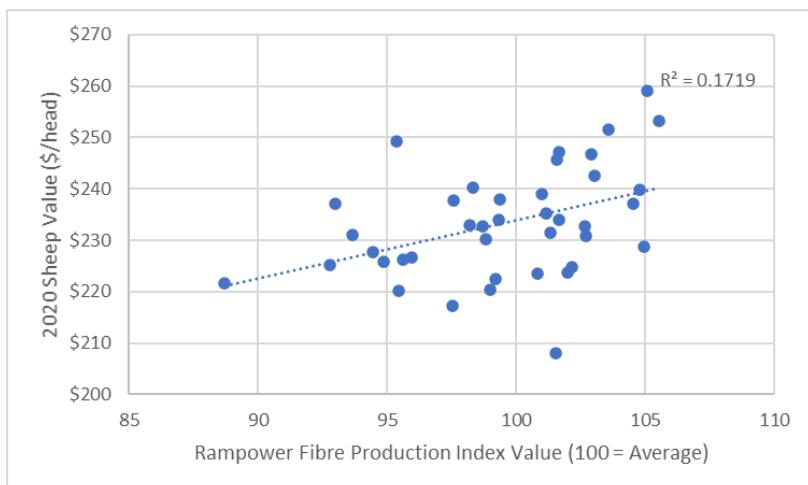

Figure 3 – Sheep Value relative to Rampower Fibre Production (FP) index

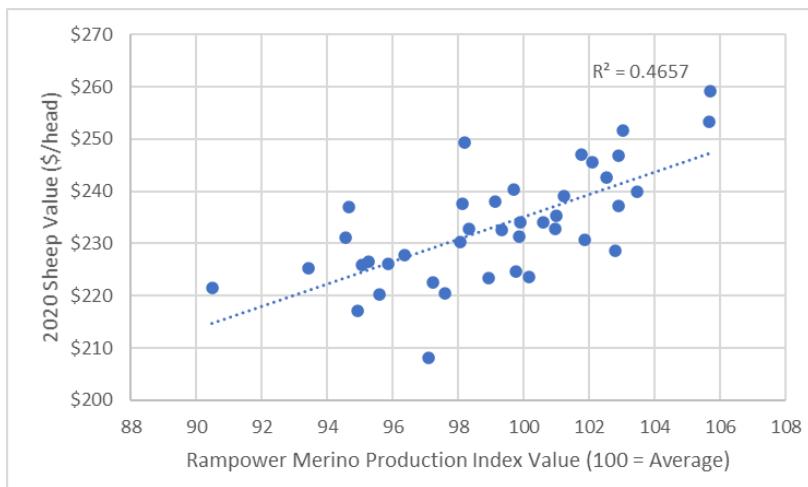

Figure 4 - Sheep Value relative to Rampower Merino Production (MP) index

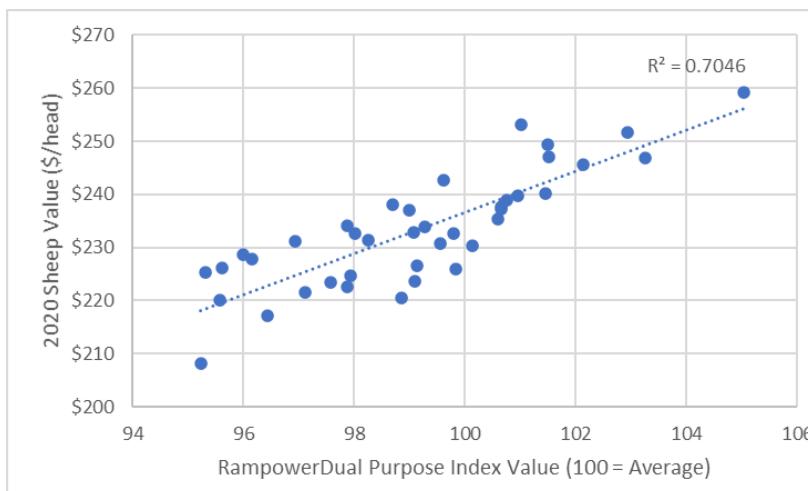

Figure 5 – Sheep Value relative to Rampower Dual Production (DP) index

4.6 Within Team Variation

Table 10 presents a summary of the variation within each team for four production traits collected at the 2020 shearing. *FD* = Micron; *GWW* = Greasy Wool Weight (fleece + oddments); *CWW* = Clean Wool Weight (fleece + oddments); *BWT* = body weight (off shears).

4.7 The Yield Story

The seasonal conditions since the 2019 shearing have been challenging to say the least. One trait of interest at shearing was yield. The wethers were mid side sampled in early February 2020 to enable the micron, yield and staple length measurements to be available for shearing in early March 2020. Between the sampling and shearing the wethers had approximately 35mm of rain on them and were trucked from Lockhart to Junee for shearing. The overall average yield for 2020 was down 17% compared to 2019.

Figure 6 shows the yield distribution across year (2019 and 2020). The distribution shows a normal bell curve. It is important to remember the distribution from the average rather than the absolute value is what we are looking for. When we compare the team average yield between years the correlation is moderate to high (0.69), shown in Figure 7. It is worth remembering in this instance that some wool types are more prone to dust penetration. There was also very little, if any correlation between yield and staple length across both assessment years (2019 and 2020) as shown in Figure 8.

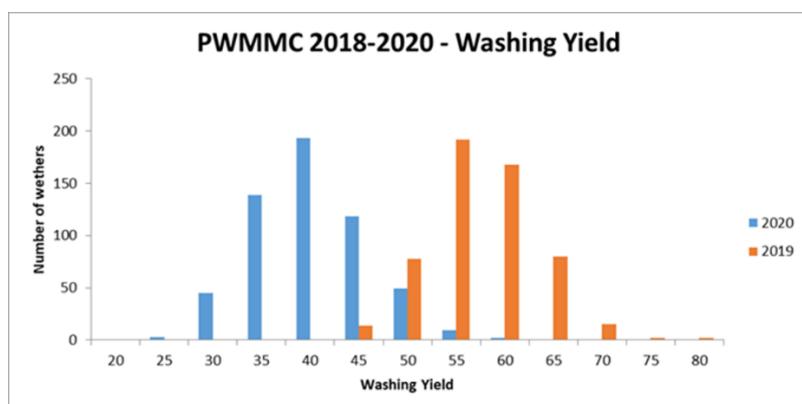

Figure 6 - Yield distribution between assessment years (2019 and 2020)

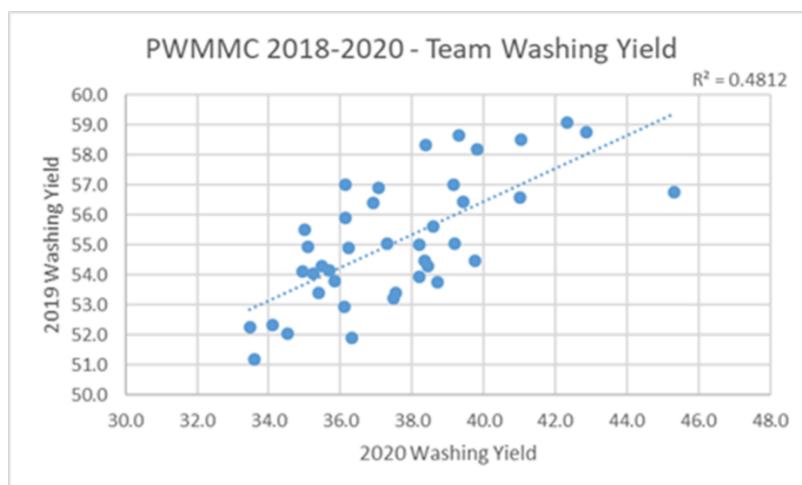

Figure 7 - Team yield between assessment years (2019 and 2020)

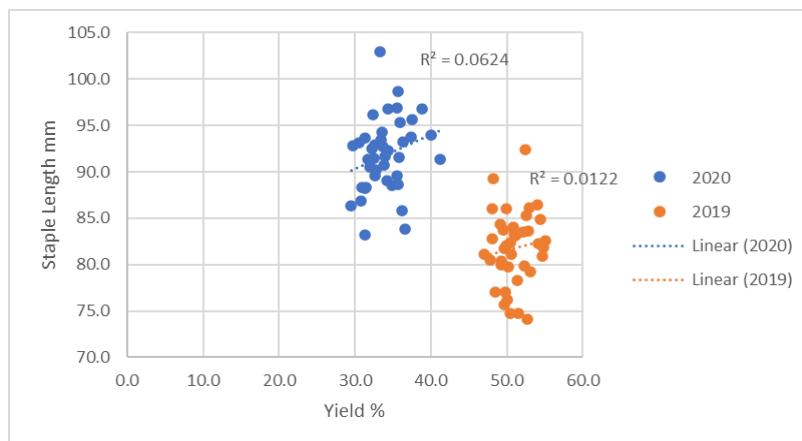

Figure 8 – Yield and staple length comparison between assessment years (2019 and 2020)

Each fleece was tracked to bale lines enabling a comparison between the mid side sample result and the bale sales advice parameters. There was a very high correlation (0.99) in 2020 between the mid side sample yield result and the bale lot yield result shown in Figure 9. This is consistent across years as can be seen in Figures 10 and 11, 2014 and 2016 respectively.

4.8 Body Wrinkle Scores

Body wrinkle scores were collected post shearing following the Visual Sheep Scores guide, Version 2 (2013). A deviation from the average trait score for all teams is reported as well as the percentage of the team's wethers recorded for each trait in Table 11. A negative deviation indicates a plainer bodied wether.

BODY WRINKLE (BDWR)

Age: Over 4 months.

When: Within 1 month post shearing, preferably straight off-shears.

Definition: Body wrinkle refers to the degree and quantity of wrinkle on the body.

Note: Body wrinkle and neck wrinkle are highly correlated traits.

Depending on the flock, only one trait may need scoring.

How to score: A single score of 1, 2, 3, 4 or 5.

Rule of thumb: A sheep with Score 1 has a plain body with no wrinkles. A Score 5 sheep has extensive wrinkles and heavy folds of skin over its entire body.

Score 1:

Plain-bodied sheep with no body wrinkle.

Score 2:

Plain-bodied sheep with a few small wrinkles over the body.

Score 3:

Slight wrinkling over the body.

Score 4:

Heavy wrinkling over the body.

Score 5:

Very heavy wrinkling and heavy folds of skin over the body.

4.9 Body wrinkle and clean wool weight compared

Body wrinkle scores were collected in 2019 post the first assessment shearing. In figures 12 and 13 shows the correlation between body wrinkle scored in 2019 relative to the clean wool weight in 2019 and 2020, respectively. Interestingly the correlation in 2019 was low (0.35) while comparing the body wrinkle in 2019 to the 2020 clean wool weight there was a 0.51 (moderate) correlation. Ideally scoring the body wrinkle a second time would have provided some more robust information.

Figures 14 and 15 show the correlation between body wrinkle and greasy wool weight, the correlation was similar for the 2019 comparison (low correlation 0.37) while the 2020 results saw a high correlation (0.73) between wrinkle and greasy wool weight. No adjustment for age has been made when comparing body wrinkle.

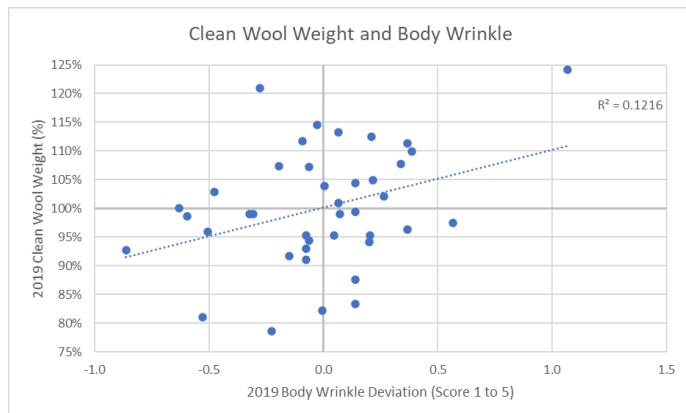

Figure 12 – Body wrinkle (2019) relative to clean wool weight (2019)

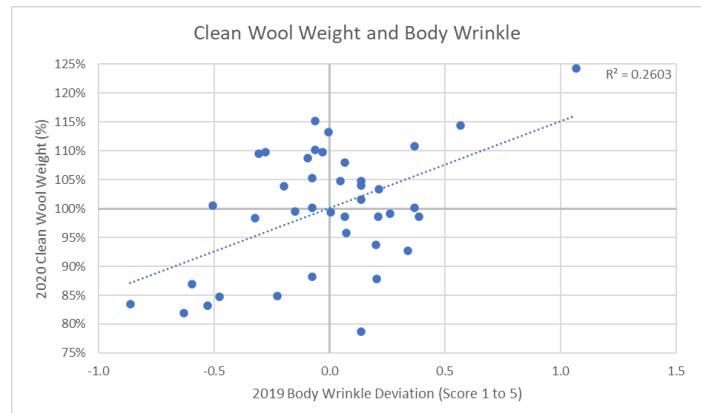

Figure 13 – Body wrinkle (2019) relative to clean wool weight (2020)

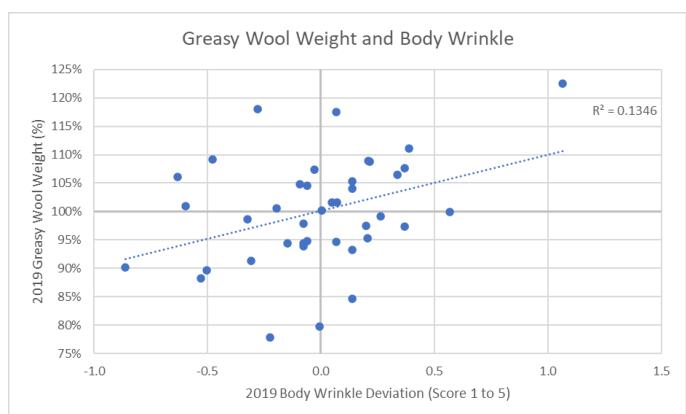

Figure 14 – Body wrinkle (2019) relative to greasy wool weight (2019)

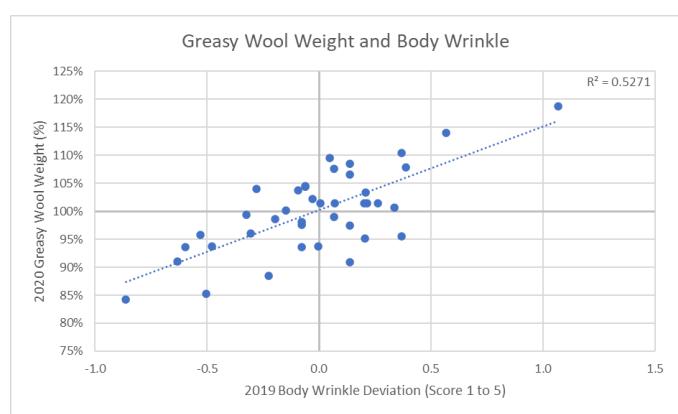

Figure 15 – Body wrinkle (2019) relative to greasy wool weight (2020)

5.0 Individual team results

There are two ways to value a wether trial shearing, Single/Individual or Bin Line valuation methods. The Single/Individual method values each fleece independently based on the fleeces own measured and visual assessment. **The Bin Line Method aims to replicate what occurs in a commercial shearing shed.** Prices for each bin line cannot be compared between teams. The valuation is based on the average fibre diameter, staple strength and other discounts for the fleeces allocated to each bin line within each team.

All fleeces are skirted and allocated to a bin line (within a team) for example AAAM, by a registered commercial wool classer. The average fibre diameter, yield, staple strength and staple length for those fleeces allocated to the bin line is calculated using the mid side sample test results. The mid side samples were collected 4 weeks prior to shearing. Colour and style (eg MF5) classifications are included with the measured information to allocate a price per bin line. All fleeces in the bin line receive the same price (as in a commercial situation).

In the table below you will notice all the fleeces allocated to the AAAM bin line have the same value, this was calculated using the average micron (16.7um) and staple strength (41 N/ktex) and average wool price for the past 26 months.

If fleeces do not meet the standards of the main line (AAAM) they are allocated to another bin line (eg AAAE (tender) or AAAC (colour)) and priced accordingly using the average objective measurements and price discounts for each separate bin line. A summary of the bin lines is presented for each team. The oddments (pieces and bellies) are valued on a team basis using the average fibre diameter and staple strength for the whole team. The fleece value and a portion of the oddments makes up the **wool value** per head; this is then averaged for each team. An example of the individual results is presented below.

Extensive Livestock Unit

The Extensive Livestock Unit is one of five units (including Intensive Livestock, Soils, Pastures and Climate) that constitute the Livestock Systems Branch of NSW DPI Agriculture.

Key areas of R&D focus:

- Undertaking R&D that improves the productivity and profitability of the extensive livestock sector
- Providing R&D solutions to problems affecting producers within NSW, nationally and internationally

Key R&D Program and sub program areas:

Increase productivity and innovation in agriculture

Livestock Productivity

- Livestock Genetics and Breeding
- Livestock Production
- Livestock Health and Welfare

Increase capacity of the agricultural sector to respond to risks & adapt to change

Climate resilience

- Climate Adaptation & Mitigation

Increase market access and development

Agricultural competitiveness

- Supply Chains and Market Access

Capacity and capability

The Extensive Livestock unit has three operational sub units: Animal Production, Genetics, and Value Chain, with a total of 37 full time equivalent staff located in 9 offices around the state:

- Livestock Industries Centre, University of New England, Armidale
- Animal Breeding and Genetics Unit, University of New England, Armidale
- CSIRO FD McMaster Laboratory, Chiswick, Armidale
- Wagga Wagga Agricultural Institute
- Elizabeth Macarthur Agricultural Institute, Menangle
- Trangie Agricultural Research Centre
- Cowra Agricultural Research and Development Station
- Orange Agricultural Institute
- NSW DPI Office, Dubbo

Examples of current R&D projects:

- 3D camera imaging for phenotypic trait estimation of beef and sheep carcass yield
- Phenotypic and genetic relationships between retail beef yield, live animal and carcass traits
- Welfare benchmarking and management for the beef cattle industry
- Productivity and efficiency at pasture – identifying improved cattle intake, productivity and efficiency
- Updating Australian feeding standards - to better reflect modern body composition and include yield and quality specification
- Genetics of Merino meat value and lifetime performance - identifying sires to improve meat yield and quality as well as favourable wool production and maternal traits in progeny
- Can on-site beef dark cutting evaluation (monitoring) be improved and value added?

Appendix 1

1. MerinoSelect Indexes – a ram buyers guide

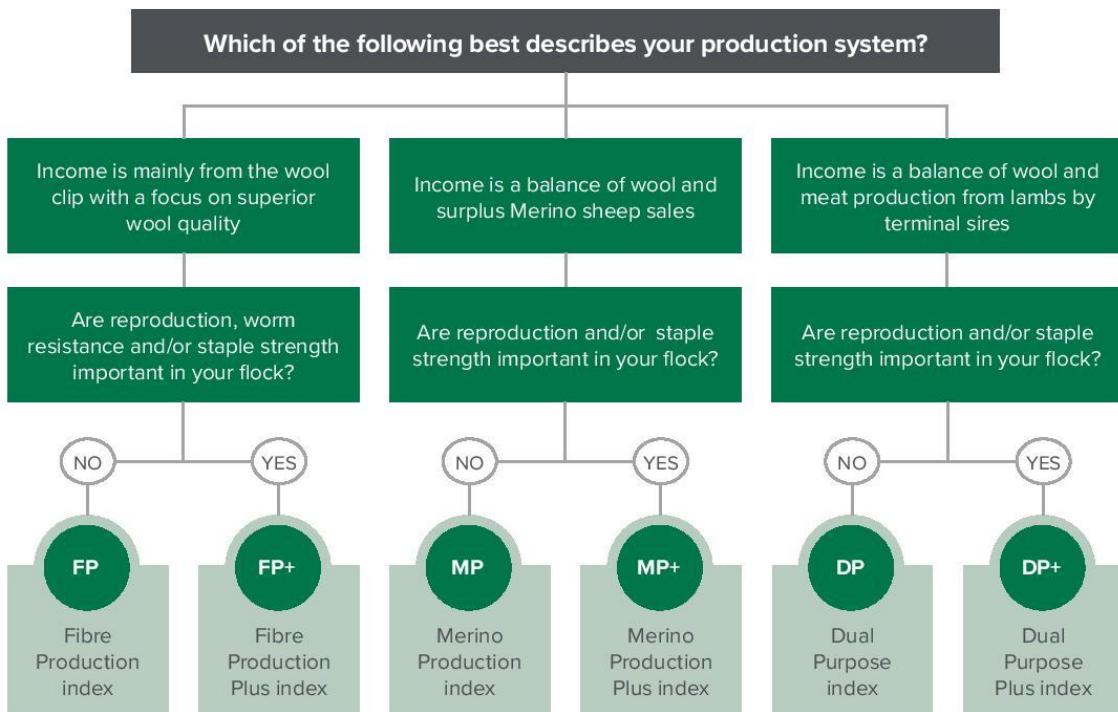

MERINOSELECT indexes A ram buyer's guide

Indexes help producers select animals for use within a breeding program when there are a range of traits of economic or functional importance, so that genetic gain in one trait is not made in isolation from other traits.

Using indexes in your ram purchasing decisions allows you to make balanced genetic progress towards more profitable sheep for your production system. A ram with a higher index will produce progeny that are more profitable in that production system.

Choosing the right index

The following flowchart helps producers determine the best index for their Merino production system:

How to use the chosen index to assist in purchasing decisions:

Before the sale:

- Rank animals in the sale on the value of your chosen index.
- Consider the individual ASBVs which are important to you to create a short list of rams to look at on sale day.

At the sale:

- Look through your short list of rams to find the ones that meet your structural and type requirements.

To assist in benchmarking sale rams relative to the current year drop of animals in the Sheep Genetics database, use the percentile band tables, which are found on the Sheep Genetics website: www.sheepgenetics.org.au/Getting-started/ASBVs-and-Indexes. The animals in the top 10th percentile rank the highest on the index, and those in the 90th percentile rank the lowest.

A brief overview of each of the indexes is included below. If you would like further information on how these selection indexes are generated, please refer to the *MERINOSELECT Indexes – ram breeder guide* at sheepgenetics.org.au/MERINOSELECT-breeder.

Fibre Production (FP) and Fibre Production Plus (FP+)

The FP and FP+ indexes are for a self-replacing Merino flock where the majority of income is from the wool clip. As this production system is commonly used in high rainfall zones where internal parasites cause significant economic losses, worm egg count is included in the FP+ index. Reproduction and staple strength are also included in the FP+ index.

Typical trait changes with the FP index:

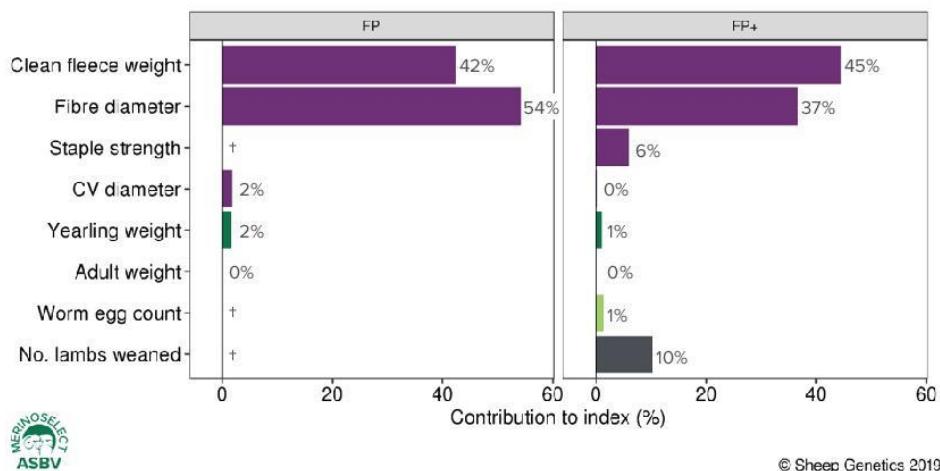

- increasing clean fleece weight
- reducing fibre diameter
- reducing CV of diameter
- small increase in yearling weight
- maintaining adult weight

Typical trait changes with the FP+ index:

- increasing clean fleece weight
- reducing fibre diameter
- reducing CV of diameter
- small increase in yearling weight
- maintaining adult weight
- increasing worm resistance
- increasing number of lambs weaned
- increasing staple strength

Figure 1 illustrates which traits are in each index and how much they contribute to the overall balance of the indexes in the top 10% of current progeny. The longer the bar, the greater the impact on the index, and the greater impact on the profitability of the production system.

Figure 1: The traits in the FP and FP+ indexes and how they contribute to the overall balance of the indexes in the top 10% of current progeny

Merino Production (MP) and Merino Production Plus (MP+)

The MP and MP+ indexes are for a self-replacing Merino flock where the income is a combination of wool and surplus Merino sheep sales. Improvement of wool income is focused on a balance of increasing fleece weight and reducing fibre diameter, with a small degree of emphasis on maintaining or slightly increasing staple strength in the MP+ index.

Typical trait changes with the MP index:

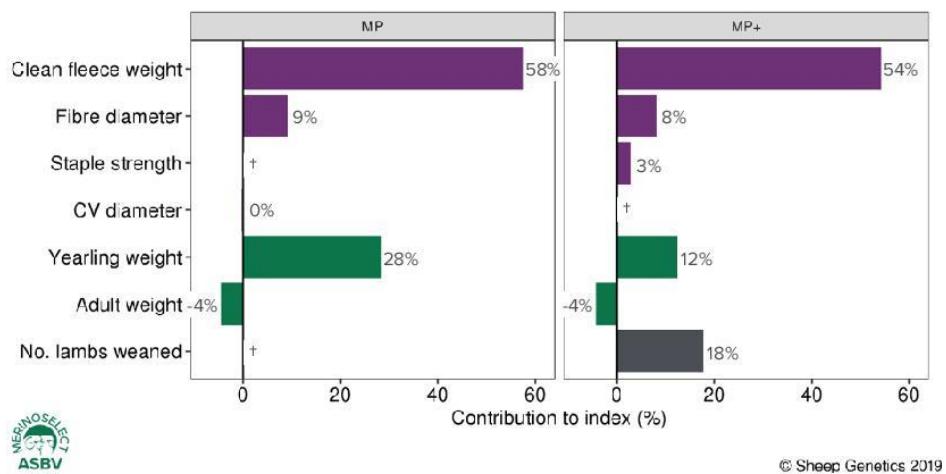

- increasing clean fleece weight
- reducing fibre diameter
- maintaining CV
- increasing yearling weight
- increasing adult weight*

Typical trait changes with the MP+ index:

- increasing clean fleece weight
- reducing fibre diameter
- maintaining CV
- increasing yearling weight
- increasing adult weight*
- increasing number of lambs weaned
- increasing staple strength

Figure 2 illustrates which traits are in each index and how much they contribute to the overall balance of the indexes in the top 10% of current progeny. The longer the bar, the greater the impact on the index, and the greater impact on the profitability of the production system.

Figure 2: The traits in the MP and MP+ indexes and how they contribute to the overall balance of the indexes in the top 10% of current progeny

* Adult weight makes a negative contribution to the index when considered on its own because bigger ewes have higher feed costs. However, bigger ewes also produce more lambs which reach sale weight faster, so the index makes a trade-off to achieve an optimal balance across all traits.

Dual Purpose (DP) and Dual Purpose Plus (DP+)

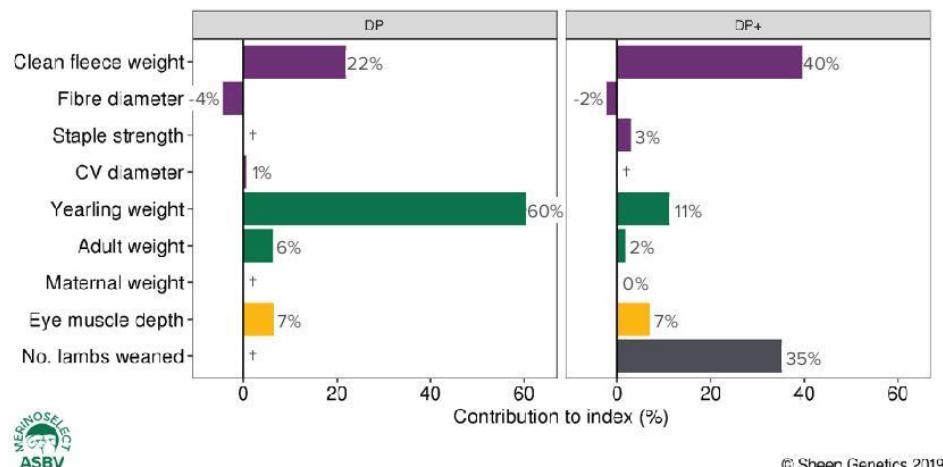

The DP and DP+ indexes are for self-replacing Merino flocks with a greater focus on lamb production, with a portion of the ewe flock mated to terminal sires to generate crossbred lambs for meat production.

This means that there is increased emphasis on growth, carcass performance, and reproduction to capitalise on the high value of lambs and to ensure that flock size is sustainable while joining to terminal sires. Wool production is still important, but the balance is on increasing fleece weight while trying to limit change in fibre diameter and staple strength.

Typical trait changes with the DP index:	Typical trait changes with the DP+ index:
• increasing clean fleece weight	• increasing clean fleece weight
• small increase in fibre diameter*	• small increase in fibre diameter*
• maintaining CV	• increasing staple strength
• increasing yearling weight	• increasing yearling weight
• increasing adult weight	• increasing adult weight
• increasing eye muscle depth	• maintaining maternal weaning weight
	• increasing eye muscle depth
	• increasing number of lambs weaned
	• increasing staple strength

Figure 3 illustrates which traits are in each index and how much they contribute to the overall balance of the index in the top 10% of current progeny. The longer the bar the greater the impact on the index, and the greater impact on the profitability of the production system outlined above.

Figure 3: The traits in the DP and DP+ indexes and how they contribute to the overall balance of the indexes in the top 10% of current progeny

* The breeding objective for the DP indexes aims to maximise the increase in fleece weight while maintaining fibre diameter at a constant level. In some circumstances, use of the DP indexes leads to small increases in fibre diameter as in the graphs shown above. If this issue is important in your flock, ASBVs for fibre diameter should be considered in conjunction with these indexes.

Factsheet current as at August 2019
